IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Previously Presented) A radio receiver comprising:

first and second antennas connected to a radio frequency processing circuitry by a radio frequency switch; and

a radio frequency switch control in communication with the radio frequency switch, the radio frequency switch control for switching between the first and second antennas in response to a predefined schedule of a sequence of scheduled packet bursts, wherein the predefined schedule is scheduled by a base station, wherein the sequence of scheduled packet bursts comprises a first signal burst received via the first antenna and a second signal burst received via the second antenna, wherein the first signal burst and the second signal burst comprise identical packets of a common message.

(Previously Presented) The radio receiver of claim 1, wherein:
 the sequence of scheduled packet bursts is prescribed by a qua-

the sequence of scheduled packet bursts is prescribed by a quality of service defined by a media access control protocol.

(Previously Presented) The radio receiver of claim 2, wherein:

the radio frequency switch control is a media access control processor that is synchronized with transmission of the base station.

(Previously Presented) The radio receiver of claim 1, wherein:

the first and second antennas are switched so that each antenna receives a related packet burst.

5. (Currently Amended) A method of maintaining a controlled quality of service in a wireless communication system, comprising:

receiving scheduled communications from a transceiver at a transmission station

in accordance with a predefined schedule <u>of a sequence of scheduled packet bursts</u> by wireless transceivers at receiving stations having switched protocol diversity reception operational modes, wherein the predefined schedule is scheduled by the transmission station to switch between a first antenna and a second antenna, where the scheduled communications being formatted as multiple packet bursts;

enabling [[a]] the first antenna to receive a first packet burst in accordance with the predefined schedule;

enabling [[a]] the second antenna to receive a second packet burst in accordance with the predefined schedule, wherein the first packet burst and the second packet burst comprise identical packets of a common message;

recording the received bursts as soft information in a storage medium; and combining the soft information from the first and second bursts into a single message.

- (Original) The method of claim 5 wherein:
 each packet burst contains a same complete message.
- (Original) The method of claim 5 wherein:

each packet burst contains a portion of a space-time coded message spread across the first and second packet bursts.

8. (Previously Presented) A method of achieving a quality of service control in a wireless local area network communication system, comprising:

transmitting a message contained within a plurality of packet bursts occurring at spaced time intervals, wherein a first packet burst and a second packet burst of the plurality of packet bursts comprise identical packets of a common message; and

receiving each of the packet bursts individually at one of a plurality of antennas in accordance with a predefined schedule, where the predefined schedule is scheduled by a base station and is used to select one of the plurality of antennas for receiving each of the packet bursts.

9. (Previously presented) The method of claim 8 wherein:

each of the plurality of the antennas is connected to a radio receiver at separate times relative to other antennas

- (Original) The method of claim 8, wherein: including a complete message within each packet burst.
- (Original) The method of claim 8 wherein:
 a message is spread across the plurality of packet bursts by space-time coding.
- (Previously presented) The method of claim 8 wherein: the transmitting combines a protocol with signal processing.
- 13. (Previously Presented) A communication system for coupling a transmitter and a receiver adapted for receiving a first signal burst and a second signal burst by a first antenna and a second antenna respectively, and responding to the two signal bursts to communicate a single unified message at the receiver; wherein:

the first and second signal bursts are sequentially separated in time in accordance with a predefined schedule, wherein the predefined schedule is scheduled by a base station, wherein the first signal burst and the second signal burst comprise identical packets of a common message:

the first and second antennas are sequentially enabled in accordance with the predefined schedule to communicate with a storage medium at the receiver; and

enabling a representation of the single unified message by responding to the first and second signal bursts.

- 14. (Canceled)
- 15. (Original) The communication system of claim 13, wherein:

the first and second signal bursts are each part of a space-time coded message spread across two bursts; and a common message is derived from the sequential signal bursts received by the first and second antennas.

- 16. (Previously Presented) The communication system of claim 13, wherein: the enabling includes retaining the first and second signal bursts in the storage medium and processing to deliver the single unified message.
- (Previously Presented) The communication system of claim 15, wherein: the deriving the common message includes selecting a message from one of the first and second antennas.
- 18. (Previously Presented) The communication system of claim 15, wherein: the deriving the common message includes decoding a space-time coded signal spread across and received by both the first and second antennas.
- (Previously Presented) The method of claim 8, further including: notifying a transmitter at a transmitting end by a receiving end of a number of antennas and radio receivers at the receiving end.
- (Previously Presented) The method of claim 8, further including:
 a receiver notifying a transmitter that the receiver accepts and responds to protocol-assisted diversity operations.
- (Previously Presented) The method of claim 8, further including: upon reconstruction of a received message sending a message to a transmitting end to cease further message bursts.
